

PHYS 445W: Materials and Quantum Phys Lab

Jed Brody

The purpose of this course is to broaden and refine your laboratory and analytical skills, to perform sophisticated experiments in quantum physics and materials characterization, and to communicate your results in written reports that are clear, concise, and complete. You will choose four of six available modules:

Quantum entanglement: Shine violet light through a beta barium borate crystal to create pairs of entangled infrared photons, and demonstrate a violation of a Bell inequality. This apparatus was funded in part by a grant from the [Reichert Foundation](#).

Quantum optics analogies: Investigate the quantum eraser and quantum cryptography. For simplicity, laser beams are used instead of single photons.

Atomic force microscope: Observe the microstructures in diffraction gratings, CDs, DVDs, and butterfly wings. May the atomic force be with you.

Pulsed NMR: Explore the physics underlying MRI.

Optical pumping: Investigate hyperfine and Zeeman interactions in rubidium.

LabVIEW: Acquire basic proficiency in sophisticated interfacing software used in many research labs. Record the IV curve of a diode, and derive the ideal diode equation.

You will write lab reports for **three** of your **four** modules.

REVISIONS AND LATE POLICY

- If the late policy is too lax, some students wait until finals week to begin their lab reports. They discover, far too late, that it takes much longer to write lab reports than they expected.
- In a sincere effort to be helpful, I'm now requiring **at least one page by the rough-draft deadline**. If you miss this deadline, your maximum score on the lab report is 28/30, no matter how many drafts you submit.
- You may rewrite each lab report as many times as you want until **May 2. This is a firm deadline!** Grades for graduating seniors must be on OPUS by about May 4, and I need time to read the reports.
- Please give me a week to read drafts.
- It may take many drafts to get a perfect score.

Grades are determined as follows:

90 points Three lab reports (30 points each)

10 points Individual conference to discuss your data

Please do not hesitate to contact me (jbrody@emory.edu) if you'd like help understanding any experimental principles or procedures. That's why I'm here.

INTRODUCTION

January 10: Module overview. Electronics tutorial (part 1).

January 12: Module selection. Electronics tutorial (part 2).

MODULE 1

January 17, 19, 24, 26, 31; February 2

MODULE 2

February 7, 9, 14, 16, 21, 23

MODULE 3

February 28; March 2, 14, 16, 21, 23

MODULE 4

March 28, 30; April 4, 6, 11, 13

INDIVIDUAL CONFERENCES TO DISCUSS YOUR DATA

April 18, 20

Guidelines for Writing Lab Reports

Your lab report should be clearly written and correct. It will probably consist of five or six sections.

1. The abstract is a single short paragraph that summarizes the report. It gives the main objectives and conclusions of the experiment. **Specific, quantitative results** must be included. Many readers of scientific papers read only the abstracts and the figure captions before deciding whether the whole paper is worth reading. The abstract is sometimes in the present tense, never the future tense. I've often written my abstract

by copying the **conclusion** section, rephrasing it a little, and adding an introductory sentence in front.

2. Introduction. This section introduces all the theory that the reader will need to understand the subsequent sections. Any equations that you'll use are given here with qualitative descriptions. Define all variables! If you like, you may **briefly** discuss the historical background and importance of the experiment.
3. Procedure. This section contains a description of the experimental process. In principle, someone should be able to reproduce your experiment after reading this section. The procedure, unlike the lab manual, is **always in first or third person**, never second person. (**Incorrect:** Turn on the laser. **Correct:** We turned on the laser. **Correct** but less clear: The laser was turned on.)
4. Results. This section is for your experimental data tables and all other unprocessed data collected during the experiment. (The text **must** refer to every table and figure. Example: "Figure 1 shows....") I tend to combine this section with the subsequent section and call it "Results and discussion."
5. Analysis and discussion. In this section, the theory from the introduction is applied to your own data. Manipulation of the data from the results section is presented here. Graphs showing functional relationships among experimental parameters are usually the best way to present your findings. It is frequently desirable to show theoretical curves and experimental data values on the same plot.
6. Conclusion. What do you want the reader to remember about your report? What results or insights are you proud of? How can you clearly and concisely summarize what you've learned? If appropriate, comment on the limitations of your findings, or suggest future work.

Your lab report will be graded with the following in mind:

Understanding: Do you correctly explain the physics underlying the experiment?

Completeness: Have you left out anything?

Clarity: Is your report clear and to the point? Define variables as you introduce them. **Remember that units are very important.** Include units in the axis labels of graphs and the headings of tables.

Ambiguity: **This is very important!** Think about ambiguity, and avoid it. Examples:

- "Inadequately focused, we could not see anything with the microscope." In this sentence, what (or who?) was inadequately focused?
- "In free space, he came up with a value of $c = 2.99796 \times 10^8$ m/s." In this sentence (from an actual lab report!), who (or what) is in free space?

Both examples above illustrate the common error of a **misplaced modifier**.

Poets want every word to mean as many things as possible; science writers want exactly the opposite. Every single sentence in your report should have only one possible interpretation.

Significant digits: Be reasonable. Do not show ten significant digits in your results unless there are ten significant digits in your raw data.

Uncertainties and error propagation: This is a sophisticated subject. A good introduction is <http://user.physics.unc.edu/~deardorf/uncertainty/UNCguide.html>, which also explains how the uncertainty determines the number of significant digits to use in the measured result. A more advanced treatment is <http://www.physics.umd.edu/courses/Phys261/F06/ErrorPropagation.pdf>.

Captions: Figure captions go **below** the figure. Table captions go **above** the table. (This is an arbitrary but universal rule; check any journal.) Only the first letter of each sentence is capitalized. The first sentence in a caption is typically a fragment, as in "Figure 1. The apparatus." Subsequent sentences, if there are any, are complete sentences.

Equations: Even sentences containing equations should be punctuated normally. Avoid sentence fragments. The format for equations is as follows:

We now will study the beloved Pythagorean Theorem,

$$a^2 + b^2 = c^2. \tag{1}$$

Equation (1) shows.... (*Notice the period in the previous line!*)

Spelling and grammar: Proofread.

Most common grammatical error: Run-on sentences (specifically, comma splices, which are common in informal writing but inappropriate in scientific papers).

INCORRECT: I love writing lab reports, I weep at the beauty of my work.

CORRECT: I love writing lab reports; I weep at the beauty of my work.

CORRECT: I love writing lab reports, and I weep at the beauty of my work.

CORRECT: I love writing lab reports. I weep at the beauty of my work.

Another common grammatical error: Not knowing the difference between "its" and "it's."

Accommodate your reader: Good scientific papers accommodate both the "lazy reader" and the "thorough reader":

- The "lazy reader" reads only the abstract and the figure captions. All the evidence that you've accomplished something interesting should appear in the abstract, figures, and figure captions. The abstract should stand on its own and make sense to someone who hasn't read the rest of the paper. Each figure with its caption should similarly make sense to someone who hasn't read the rest of the paper.
- The "thorough reader" (possibly a "lazy reader" impressed by your abstract and figures) wants to read a **continuous narrative** from start to finish. This reader will ignore your figures and tables until the text refers to them; you should guide your reader to each figure and table whenever you want your reader to look there.

Plagiarism: Plagiarism is a violation of the Emory Honor Code. You are expected to write your laboratory reports on your own. Any unique phrases lifted directly from any source, including the internet, must be enclosed in quotation marks with the source clearly identified. All sources that you studied to gain understanding while preparing to write your laboratory report, including links to the internet, should be listed at the end of your report under References. If you are ever in doubt, identify the source of your material. In particular, **be sure to cite the source of any graphics you download into your report.** I don't like to be bossy, but I'd like to help you avoid the mistakes made by former students. Therefore, just to be helpful, I'm providing a list of things that you may not do:

- You may not copy entire paragraphs from any source. In physics papers, we almost never quote exact text.
- You may not do a sentence-by-sentence paraphrase of any document. I know it's hard to come up with a unique explanation of a technical topic, but the idea is to understand it well enough to pull the sentences "out of your head" (or your notes).
- You may not use anyone else's data in lieu of data you're supposed to record yourself. You may, however, cite anyone else's data for purposes of discussion.
- If you don't show up in lab, you may not use your lab partner's data. Equivalently, you may not share your data with a so-called lab partner who doesn't show up in lab. If you can't come to lab due to quarantine, we'll find remote experiments for you to do.

Course policies:

- You may have one lab partner or work alone. To make sure you have adequate opportunity for hands-on lab experience, we avoid groups of 3 or more. (Exceptions are made for quantum entanglement and quantum optics analogies.)
- You and your lab partner may share data, but you write separate lab reports.
- May 2 is the final deadline for all lab reports!
